Solution

for an arbitrary codeword $c = [x; y; z]$: $[xyz] \begin{bmatrix} 2 & 4 & 1 & 0 & 0 & 1 & 1 & 1 & 3 & 5 \end{bmatrix} = [x+z; y+z]$ So, $c = [xyz]$ is a valid codeword if $cHT = 0$, i.e. if $[y+z; x+z] = [0; 0]$.

Algebraic manipulations over binary show that $x=y=z$. Thus the only valid codewords are indeed $f000; 111g$.

Error-correcting codes play a fundamental role in minimising data corruption caused by defects such as noise, interference, crosstalk and packet loss. This book provides an accessible introduction to the basic elements of algebraic codes, and discusses their use in a variety of applications.

Algebraic Codes for Data Transmission by Richard E. Blahut

The term algebraic coding theory denotes the sub-field of coding theory where the

Download Ebook Algebraic Codes Data Transmission

Solution properties of codes are expressed in algebraic terms and then further researched. [citation needed] Algebraic coding theory is basically divided into two major types of codes: [citation needed] Linear block codes; Convolutional codes; It analyzes the following three properties of a code \square mainly: [citation needed]
