Periodic Table of Elements - PubChem

The periodic table is a tabular array of the chemical elements organized by atomic number, from the element with the lowest atomic number, hydrogen, to the element with the highest atomic number, oganesson. The atomic number of an element is the number of protons in the nucleus of an atom of that element. Hydrogen has 1 proton, and oganesson has 118.

ChemFest got off to what Dame Mary called 'a flying start' in early March when we unveiled a celebratory display which included an 1869 journal containing Mendeleev's first published periodic table as well as a collection of elements that were amassed a few decades later by French politician and linguist Prince Louis Lucien Bonaparte. In one of the most prominent places in the museum, it has been seen by a significant proportion of the Science Museum's 3.2 million annual visitors.

Periods are often defined as recurring sets of behavior. Russian chemist and inventor Dmitri Mendeleev was one of the first scientists to realize the attributes that certain groups of chemical elements had in common. He used this observation and formed one of the earliest versions of the periodic table. Mendeleev then sorted the elements according to these patterns to create the periodic table as it is known today.

New York Times

The seven rows of the table, called periods, generally have metals on the left and nonmetals on the right. The columns, called groups, contain elements with similar chemical behaviours. Six groups have accepted names as well as assigned numbers: for example, group 17 elements are the halogens; and group 18 are the noble gases. Also displayed are four simple rectangular areas or blocks associated with the filling of different atomic orbitals. The organization of the periodic table can be used to
