To be useful, chemical indicators must be both sensitive and easily detectable. It need not, however, show a visible change. The type of indicator depends on how it's being used. For example, a sample analyzed with spectroscopy may employ an indicator that wouldn't be visible to the naked eye, while a test for calcium in an aquarium would need to produce an obvious color change.

~~What Is a Chemical Indicator?~~

Chemical indicator, any substance that gives a visible sign, usually by a colour change, of the presence or absence of a threshold concentration of a chemical species, such as an acid or an alkali in a solution. An example is the substance called methyl yellow, which imparts a yellow colour to an alkaline solution. If acid is slowly added, the solution remains yellow until all the alkali has ...

Artificial and Natural indicators are the two types of Chemical indicators. Litmus, red cabbage, turmeric, china rose are a number of the present indicators around us. Artificial Indicators. Litmus Litmus is the most ordinarily used natural chemical indicator used. It is the answer to various sorts of dyes naturally obtained from lichens.

~~Chemical Indicators - Definition and Types~~

It is important to note that chemical indicators alone do not confirm that an item is sterile. Chemical indicators must be used as part of comprehensive quality control program, that also includes the use of biological indicators and physical monitors, to assure that the conditions for sterilization were met.

This is a very sensitive chemical indicator that does not participate significantly in the oxidation-reduction reaction in a solution. Another common example of a very sensitive chemical indicator with a narrow range is diphenylcarbazone. It indicates an increase in mercuric ion concentration from 0.000001 to 0.00001 mole per litre.

~~What Is A Chemical Indicator Used For?~~

Indicators are substances whose solutions change color due to changes in pH. These are called acid-base indicators. These are called acid-base indicators. They are usually weak acids or bases, but their conjugate base or acid forms have different colors due to differences in their absorption spectra.

Acid-Base Indicator Definition . An acid-base indicator is either a weak acid or weak base that exhibits a color change as the concentration of hydrogen (H +) or hydroxide (OH-) ions changes in an aqueous solution. Acid-base indicators are most often used in a titration to identify the endpoint of an acid-base reaction.

A pH indicator is a halochromic chemical compound added in small amounts to a solution so the pH (acidity or basicity) of the solution can be determined visually. Hence, a pH indicator is a chemical detector for hydronium ions (H_3O^+) or hydrogen ions (H^+) in the Arrhenius model. Normally, the indicator causes the color of the solution to change depending on the pH.

If the internal or external indicator suggests inadequate processing, the item that has been processed should not be used. Because chemical indicators do not prove sterilization has been achieved, a biological indicator (i.e., spore test) is required. Biological indicators

We have developed new absorption-based chemical indicators for detecting chloroform (CHCl_3) and trichloroethylene (TCE). These indicators were used to make very sensitive optical chemical sensors (optrodes) for each of these two contaminants. Concentrations below 10 ppb can be accurately measured using these sensors. Furthermore, they are selective and do not respond to similar contaminants commonly found with TCE and CHCl_3 in contaminated groundwater. In addition, the sensor response is linearly proportional to the chemical concentration. In this report, we describe the details of this optrode and the putative reaction sequences of the indicator chemistries with CHCl_3 and TCE and present an analysis of the spectral data obtained from the reaction products. A key part of the development of this optrode was designing a simple readout device. The readout is a dual-channel fiber-optic fluorimeter modified to measure transmission or absorption of light. The system is controlled by a lap-top microcomputer and is fully field portable. In addition to describing the final absorption optrode, details of the chemical indicator reactions are presented for both absorption- (colorimetric) and fluorescence-based optrodes. Finally, we report on the syntheses of several compounds used to evaluate the indicator chemical reactions that led to the development of the absorption optrode. 23 refs., 26 figs., 1 tab.
