Definition of Process Costing Process costing is a term used in cost accounting to describe one method for collecting and assigning manufacturing costs to the units produced. A processing cost system is used when nearly identical units are mass produced.

In the classroom, ABC looks like a great way to manage a company's resources. But many executives who have tried to implement ABC on a large scale in their organizations have found the approach limiting and frustrating. Why? The employee surveys that companies used to estimate resources required for business activities proved too time-consuming, expensive, and irritating to employees. This book shows you how to implement time-driven activity-based costing (TDABC), an easier and more powerful way to implement ABC. You can now estimate directly the resource demands imposed by each business transaction, product, or customer. The payoff? You spend less time and money obtaining and maintaining TDABC data—and more time addressing problems that TDABC reveals, such as inefficient processes, unprofitable products and customers, and excess capacity. The authors also show how to use TDABC to link strategic planning to operational budgeting, to enhance the due diligence process for mergers and acquisitions, and to support continuous improvement activities such as lean management and benchmarking. In presenting their model, the authors define the two questions required to build TDABC: 1) How much does it cost per time unit to supply resource capacity for each business process? 2) How much resource capacity (time) is required to perform work for a company's many transactions, products, and customers? The book demonstrates how to develop simple, valid answers to these two questions. Kaplan and Anderson illustrate the TDABC approach with a wealth of case studies, in diverse settings, based on actual implementations.

Service firms have high overhead costs which are difficult to assign to individual services. To bring transparency to their value chain, they need costing approaches that help them find their own improvements. Markus B. Baum explores current theory and practice of value chain approaches and cost accounting to develop a costing approach with a suitable instrument for the allocation of fixed and overhead costs for a service firm. He describes the service business costing (SBC) approach. This hybrid-costing model has a hierarchical structure in terms of consolidation and allocates cost and revenues on the lowest hierarchical level possible to ensure that all costs and income are assigned to activities from which they originated.

Target Costing: The Next Frontier in Strategic Cost Management is the one-and-only reference of its kind, providing practical insights on using target costing to build a culture of excellence in your organization. Shahid Ansari, Jan Bell and the CAM-I Target Cost Core Group focus on the details and show how this strategic management process can provide your customers with the products they want, when they want them, at a price they can afford - and still earn your firm reasonable financial returns. The CAM-I group realized target costing was critical for success in our global economy and collaborated on this landmark work. Relying on state-of-the-art practices drawn from over 80 Japanese works, global best practices and personal experience, Target Costing describes the scope, framework, process and tools for implementing a robust and integrated target costing system.

This book addresses an important issue -- the nature of and evidence for success in the transfer costing of internal services or shared services or products within a company. The case of activity-based costing (ABC) is used to explore how the proponents have developed a framework linking Quality, Cost and Delivery (QCD) components of products and services.The QCD performance indices, which are the natural properties of products and services, will form part of the Service Level Agreements between the internal service providers (Shared Services Centers) and internal customers (Profit Centers) of the company. This framework optimizes the use of overhead expenses to the end products of the company.This book also discusses the various cost components of the products and services using the full absorption costing principle. It is a revolutionary idea in the sense that all activity costs are considered variable costs and product costs come from activity costs using various cost drivers.The Principal Component Analysis (PCA), the multi-variate statistical tool, is applied using SPSS to analyze which independent variables contribute significantly to the Product Unit Price (PUP) and which should be given more emphasis in decision making process.

Evaluating the cost of acquiring major pieces of equipment also necessitates costing their life maintenance. Providing coverage of recent advances in this field, this book covers such topics as reliability improvement warranty, computer hardware/software costing, and reliability engineering.
