Epilepsy: The Facts is written specifically for sufferers of epilepsy and their friends and families. This easy-to-understand, evidence-based guide to epilepsy explains everything about the causes and effects of the disease, clearly and simply. The book addresses all aspects of epilepsy, at all ages. It begins with basic descriptions and definitions of seizures, through the classification of seizures and epilepsy syndromes. The different forms of investigation are described in detail including drug and non-drug treatment options. Further chapters discuss the effects of epilepsy on lifestyle, education and career choice and future developments. Positive, constructive advice is presented by the authors throughout the book to help sufferers manage their condition and cope with problems as and when they arise, especially in relation to many aspects of normal life such as schooling, pregnancy, driving, and work.This new edition represents a unique approach to the group of conditions known as 'epilepsy' and is the only publication of its kind in the UK.

Describes the causes of epilepsy, different types of seizures, and methods of treatment, and tells how epileptics can lead a nearly normal life.

Epilepsy, traditionally the Cinderella of medicine, now has a higher profile thanks to the efforts of the World Health Organisation who have led a campaign called Out of the Shadows, to make the public more aware of the condition. In particular, there has been much more awareness of the plight of women with epilepsy and their reproductive health, especially the problem of certain anti-convulsant medications and their effects on the unborn child. This new edition strengthens the focus on women and gives a strong update on drugs and surgery, a sometimes neglected but modern approach which may actually cure epilepsy.

Epilepsy is a disease of the brain that causes recurrent unprovoked seizures. Several causes exist, including head trauma, stroke, brain tumor, and brain infection. Other causes include drug effects or intoxication, genetics, and metabolic disturbances. This guidebook provides essential information on Epilepsy, but also serves as a historical survey, by providing information on the controversies surrounding its causes, and first-person narratives by people coping with Epilepsy. Patients, family members, or caregivers explain the condition from their own experience. The symptoms, causes, treatments, and potential cures are explained in detail. Essential to anyone trying to learn about diseases and conditions, the alternative treatments are explored. Each essay is carefully edited and presented with an introduction, so that they are accessible for student researchers and readers.

Presents articles dealing with two hundred and eighty diseases and disorders, from acne and brain tumor to tobacco-related diseases and yellow fever.

Sixty percent of the epilepsies start in childhood, and most of the clinically significant and often life-changing aspects of the disease occur at this time. Childhood epilepsy is frequently a complex disorder, demanding integrated medical, educational and community services. Its treatment encompasses acute and disability medicine. The many types or syndromes of childhood epilepsy present both diagnostic and management challenges. Although many children with epilepsy will be referred to specialist units, the majority will initially present to paediatricians and paediatric neurologists. This book provides a practical, problem-oriented manual to help clinicians with diagnosis, evaluation and management. This book addresses epilepsy as an evolving disorder from presentation, through active disease and finally to either spontaneous remission or a chronic lifelong condition. Structured on the child's age at presentation, Childhood Epilepsy offers a practical overview for paediatricians, paediatric neurologists and primary care practitioners who treat children with epilepsy in their daily practice.

Part of the Oxford Neurology Library, this concise pocketbook highlights the importance of epilepsy, its diagnosis, the problems of misdiagnosis, and current thoughts on its pathogenesis, acute treatment and rehabilitation, in both children and adults.

Although epilepsy is one of the nation's most common neurological disorders, public understanding of it is limited. Many people do not know the causes of epilepsy or what they should do if they see someone having a seizure. Epilepsy is a complex spectrum of disorders that affects an estimated 2.2 million Americans in a variety of ways, and is characterized by unpredictable seizures that differ in type, cause, and severity. Yet living with epilepsy is about much more than just seizures; the disorder is often defined in practical terms, such as challenges in school, uncertainties about social situations and employment, limitations on driving, and questions about independent living. The Institute of Medicine was asked to examine the public health dimensions of the epilepsies, focusing on public health surveillance and data collection; population and public health research; health policy, health care, and human services; and education for people with the disorder and their families, health care providers, and the public. In Epilepsy Across the Spectrum, the IOM makes recommendations ranging from the expansion of collaborative epilepsy surveillance efforts, to the coordination of public awareness efforts, to the engagement of people with epilepsy and their families in education, dissemination, and advocacy for improved care and services. Taking action across multiple dimensions will improve the lives of people with epilepsy and their families. The realistic, feasible, and action-oriented recommendations in this report can help enable short- and long-term improvements for people with epilepsy. For all epilepsy organizations and advocates, local, state, and federal agencies, researchers, health care professionals, people with epilepsy, as well as the public, Epilepsy Across the Spectrum is an essential resource.

The pharmacological fight against epilepsy began many centuries ago when Hippocrates discovered that the cause of epilepsy is natural, as opposed to supernatural and, as a consequence, must be treated with a natural remedy. Even though science has significantly progressed since that era, the challenge to find remedies for epilepsy is ever present. The aim of this particular

volume is to offer an up-to-date review of the most recent advances in antiepileptic drug development, considered from various viewpoints: (i) general, by taking into account the size of refractory epilepsy and its related problems; (ii) experimental, by exploring the mechanisms of epileptogenesis and the possibility of influencing it through drugs, and (iii) clinical, by describing the results obtained with compounds currently at an advanced stage of testing.
