Although Africa is the most under-supplied region of the world for electricity, its economies are utterly dependent on it. There are enormous inequalities in electricity access, with industry receiving abundant supplies of cheap power while more than 80 per cent of the continent's population remain off the power grid. Africa is not unique in this respect, but levels of inequality are particularly pronounced here due to the inherent unevenness of 'electric capitalism' on the continent. This book provides an innovative theoretical framework for understanding electricity and capitalism in Africa, followed by a series of case studies that examine different aspects of electricity supply and consumption. The chapters focus primarily on South Africa due to its dominance in the electricity market, but there are important lessons to be learned for the continent as a whole, not least because of the aggressive expansion of South African capital into other parts of Africa to develop and control electricity. Africa is experiencing a renewed scramble for its electricity resources, conjuring up images of a recolonisation of the continent along the power grid. Written by leading academics and activists, *Electric Capitalism* offers a cutting-edge, yet accessible, overview of one of the most important developments in Africa today - with direct implications for health, gender equity, environmental sustainability and socio-economic justice. From nuclear power through prepaid electricity meters to the massive dam projects taking place in central Africa, an understanding of electricity reforms on the continent helps shape our insights into development debates in Africa in particular and the expansion of neoliberal capitalism more generally.

The study provides a demographic analysis of employment trends across the public and private sectors of the economy, and investigates the demand for engineers, technologists and technicians in the workforce. A comprehensive analysis of the educational context for engineering professionals focuses on enrolment, graduation and throughput trends in all engineering disciplines at universities and universities of technology, and reveals that although there have been positive innovations in education and training strategies in recent years, many issues, especially at secondary school level, remain a challenge. Women in engineering is a particular focus of this study, which devotes a chapter to examining the factors that influence their choice of career, the barriers they experience in the labour market and strategies for encouraging women into the profession. This comprehensive monograph offers valuable quantitative and qualitative information about engineering capacity across all engineering disciplines in South Africa. It is therefore an important reference for all engineering academics as well as decision-makers in both the private and public sectors, and will be useful to aspiring and current engineering students, whatever their field.
