In structural engineering, the tube is a system where, to resist lateral loads (wind, seismic, impact), a building is designed to act like a hollow cylinder, cantilevered perpendicular to the ground. This system was introduced by Fazlur Rahman Khan while at the architectural firm Skidmore, Owings & Merrill (SOM), in their Chicago office. The first example of the tube's use is the 43-story ...

Oxford hollow, tube) is often used to repair books that originally had a hollow, which makes sense. What makes less sense is using it on books that originally had a natural hollow, like case bindings. It adds at least three layers of paper, and only adds the strength of one thickness of paper.

For example a 31.75mm (1¼ ") by 1.24mm (0.049") tube bar is the equivalent of a 23.0mm solid bar, this solid bar has an OD which is 72.6% (23/31.75 x 100) of the tube OD, and an increase in weight of 71.5% over the tube bar. Another example is a 25.4mm by 6.35mm tube will act like a 25.0 mm solid bar as in torsion and bending (swaybar).

~~Discussion Paper Hollow versus Solid Swaybars~~

AC Inductance and Inductive Reactance Inductors and chokes are basically coils or loops of wire that are either wound around a hollow tube former (air cored) or wound around some ferromagnetic material (iron cored) to increase their inductive value called inductance.

~~Why does an inductor act as a short circuit when DC flows ...~~

I suggest in both cases, the tubes failed when they deformed away from there round Cross-section. They're being hollow was their weakness. I wonder, if the tubes were clad over a solid, non compressible core, wouldn't they behave like solid springs. If the core could be made of a much lighter material than the tube, it would save some weight.
