For this revision of their bestselling junior- and senior-level text, Guru and Hizioglu have incorporated eleven years of cutting-edge developments in the field since Electric Machinery and Transformers was first published. Completely re-written, the new Second Edition also incorporates suggestions from students and instructors who have used the First Edition, making it the best text available for junior- and senior-level courses in electric machines. The new edition features a wealth of new and improved problems and examples, designed to complement the authors' overall goal of encouraging intuitive reasoning rather than rote memorization of material. Chapter 3, which presents the conversion of energy, now includes: analysis of magnetically coupled coils, induced emf in a coil rotating in a uniform magnetic field, induced emf in a coil rotating in a time-varying magnetic field, and the concept of the revolving field. All problems and examples have been rigorously tested using Mathcad.

Kenneth Waltz's 1979 Theory of International Politics is credited with bringing about a "scientific revolution" in the study of international relations - bringing the field into a new era of systematic study. The book is also a lesson in reasoning carefully and critically. Good reasoning is exemplified by arguments that move systematically, through carefully organised stages, taking into account opposing stances and ideas as they move towards a logical conclusion. Theory of International Politics might be a textbook example of how to go about structuring an argument in this way to produce a watertight case for a particular point of view. Waltz's book begins by testing and critiquing earlier theories of international relations, showing their strengths and weaknesses, before moving on to argue for his own stance - what has since become known as "neorealism". His aim was "to construct a theory of international politics that remedies the defects of present theories." And this is precisely what he did; by showing the shortcomings of the prevalent theories of international relations, Waltz was then able to import insights from sociology to create a more comprehensive and realistic theory that took full account of the strengths of old schemas while also remedying their weaknesses - reasoning out a new theory in the process.

In 1952, at the age of 23, Helen Frankenthaler created her legendary painting Mountains and Sea. She poured thinned-down pigment directly onto unprimed canvas to be absorbed into its fibers. This large painting, the first in which Frankenthaler used her soak-stain technique, synthesized the influences that had informed her work to that point and announces her arrival as a mature artist. Published to accompany a 1998 exhibition at the Solomon R. Guggenheim Museum, New York, this book focuses on Mountains and Sea and other groundbreaking paintings of Frankenthaler's early career. In this period, Frankenthaler drew upon Cubism, the abstractions of Arshile Gorky and, especially, those of Jackson Pollock, whose radical technique inspired her to reject easel painting. Frankenthaler herself became associated with the second generation of the New York School and her unique method and experimental use of materials influenced her contemporaries and subsequent generations of artists.

John Stilgoe is just looking around. This is more difficult than it sounds, particularly in our mediated age, when advances in both theory and technology too often seek to replace the visual evidence before our own eyes rather than complement it. We are surrounded by landscapes charged with our past, and yet from our earliest schooldays we are instructed not to stare out the window. Someone who stops to look isn't only a rarity; he or she is suspect. Landscape and Images records a lifetime spent observing America's constructed landscapes. Stilgoe's essays follow the eclectic trains of thought that have resulted from his observation, from the postcard preference for sunsets over sunrises to the concept of "teen geography" to the unwillingness of Americans to walk up and down stairs. In Stilgoe's hands, the subject of jack o' lanterns becomes an occasion to explore centuries-old concepts of boundaries and trespassing, and to examine why this originally pagan symbol has persisted into our own age. Even something as mundane as putting the cat out before going to bed is traced back to fears of unwatched animals and an unintended frontier fireplace. Stilgoe ponders the forgotten connections between politics and painted landscapes and asks why a country whose vast majority lives less than a hundred miles from a coast nonetheless looks to the rural Midwest for the classic image of itself. At times breathtaking in their erudition, the essays collected here are as meticulously researched as they are elegantly written. Stilgoe's observations speak to specialists-whether they be artists, historians, or environmental designers-as well as to the common reader. Our landscapes constitute a fascinating history of accident and intent. The proof, says Stilgoe, is all around us.
