The noise control engineer or industrial hygienist must be able to make recommendations based on predictable noise control data. The fan noise is proportional to the volume of air moved and the pressure developed by the fan. Properly balancing a fan is a factor in keeping the fan quiet. The location of a fan in a ventilation system becomes an important factor if maximum noise control is to be achieved. Properly balancing a fan is an important factor in keeping the fan quiet.

Noise - noise control measures. The best way of reducing exposure is by controlling the noise at source. Where a risk assessment identifies that individuals are exposed to hazardous noise levels at work, employers need to introduce measures to control the associated risks. These measures usually involve a combination of methods, such as controlling the noise at source, redesigning the layout of workstations and re-organising the work processes.

Industrial noise control is a subset of interior architectural control of noise, with emphasis on specific methods of sound isolation from industrial machinery and for protection of workers at their task stations. Sound masking is the active addition of noise to reduce the annoyance of certain sounds; the opposite of soundproofing.
