Effect Answer Key  
Correctly predict the results of experiments of the photoelectric effect: e.g. how changing the intensity of light will affect the current and the energy of electrons, how changing the wavelength of light will affect the current and the energy of electrons, how changing the voltage of light will affect the current and the energy of electrons ...

Part 11 - The Photoelectric Effect (1) When the light shines on the surface of a metal, the light may eject electrons from the metal with additional kinetic energy. To determine how much kinetic energy is being given to the electrons from the photons of light, a set of parallel plates was setup in a vacuum.

Electrons are emitted with a range of energies because photons can eject electrons with a range of binding energies. If more of a photon's energy is used to release an electron, the emitted electron will have less kinetic energy.

Conductor or semiconductor,  
it emits election, this  
phenomenon is known as  
photoelectric effect. - This  
effect is basedon the idea  
that electroma metic  
radiation is made of  
particles called photon.
