Phlebotomy: How to learn the phlebotomy tubes

Vacutainer Tube Color Guide
These color indicators help the phlebotomist to easily select the tubes in which the blood should be drawn as per the tests that have to be performed. The additives present in the vacutainer tubes plays the most important role as every additive has a unique function and these are selected as per the tests to be performed. Here is the list of Color codes of the tube, the Additives present in them and their common uses -

COLOR CODES OF VACUTAINER TUBES AND ITS USES
Glucose. BD Vacutainer® Fluoride Tubes contain a glycolytic inhibitor and are used for glucose determinations on plasma. Closure Reference # Tube Size Draw Volume (mm) (mL) Type Colour Label type 367587* 13x75 2.0 P 367921 13x75 2.0 P 367922 13x75 4.0 P 367925 13x100 6.0 P *Contains Na2EDTA. Specialty Tubes.

BD Vacutainer - Stanford University
Tube inversions ensure mixing of either clot activator or anticoagulant (EDTA) with blood. Green Green. • Sodium heparin • Lithium heparin 8 8 For plasma determinations in chemistry. Tube inversions ensure mixing of anticoagulant (heparin) with blood to prevent clotting. Gray Gray.

BD Vacutainer Venous Blood Collection Tube Guide
Dark green. Similar to the red bottle, a green vacutainer is seldom used, and only when doing biochemistry tests that require whole blood or heparinised plasma for analysis. It is often used for insulin, ammonia, and renin and aldosterone tests. It contains the anticoagulant sodium heparin.

Vacutainer Guide - E Phlebotomy Training
This 11" x 17" wall chart includes information about BD Vacutainer® Venous Blood Collection Tubes, including: closure/stopper, additive, recommended inversions, laboratory use, section for a lab's draw volume and/or remarks.

BD Vacutainer Venous Blood Collection Tube Guide - Wall Chart
These tubes are primarily used for trace metal analysis and toxicology tests. 8. Red tubes (glass): These are additive free vacutainers used for tests for antibodies, chemistry and drugs. 9. Light...

Functional Classification and Colour Codes - Vacutainer tubes
All BD Vacutainer® tubes require immediate mixing following collection. Insufficient mixing can result in inaccurate test results and the need to re-draw. Correct mixing technique is to gently invert (180o and back) each tube the recommended number of times shown on the right hand side of the table. BD Vacutainer®

BD Vacutainer
The pink tube needs inverting about 8 times to mix the sample with the EDTA. It should contain at least 1ml of blood , but more is preferred by the labs if at all possible. It has a special label which needs to be carefully filled in by hand at the bedside to ensure the correct patient details are used, preventing potentially catastrophic mismatched blood transfusions.
