When glowflies dance, they leave trails of light, stories that circle then fade, invisible, into night air. From Mexico to Scotland to London to North Africa, the West Indies and back again, 'Glowfly Dance' is a story of travel and survival, one that explores family trauma and the experiences of a little girl who grows up looking 'different'.

is a mechanical device which operates on a closed regenerative thermodynamic cycle with cyclic compression and expansion of the working fluid at different temperature levels. The flow of working fluid is controlled only by the internal volume changes, there are no valves and, overall, there is a net conversion of heat to work or vice-versa. This generalized definition embraces a large family of machines with different functions; characteristics and configurations. It includes both rotary and reciprocating systems utilizing mechanisms of varying complexity. It covers machines capable of operating as a prime mover or power system converting heat supplied at high temperature to output work and waste heat at a lower temperature. It also covers work-consuming machines used as refrigerating systems and heat pumps abstracting heat from a low temperature source and delivering this plus the heat equivalent of the work consumed to a higher temperature. Finally it covers work-consuming devices used as pressure generators compressing a fluid from a low pressure to a higher pressure. Very similar machines exist which operate on an open regenerative cycle where the flow of working fluid is controlled by valves. For convenience these may be called Ericsson engines but unfortunately the distinction is not widely established and regenerative machines of both types are frequently called 'Stirling engines'.

The Rise of the United Association is a study of the national union of plumbers, steam fitters, sprinkler fitters, and other pipe trades--the organization known today as the United Association of Journeymen and Apprentices of the Plumbing and Pipe Fitting Industry of the United States and Canada. The study covers 40 crucial years in the history of national unionism of the pipe trades. In the beginning of the period (in the early 1880's) local unions of plumbers, gas fitters, and steam fitters were making first attempts to form a national organization of their crafts; forty years later, the United Association (UA) was unchallenged in its position as the national union of the pipe trades, and constituted one of the strongest organizations in contemporary building trades and in the AFL. The Rise of the United Association concerns itself primarily with the description and analysis of the development and policies of the national union rather than with the history of local organizations of plumbers and steam fitters. In particular, the study deals with the factors that led to the rise of the first national organization of the pipe trades and then to the founding of the UA; with the complex process of internal reform that transformed the UA - originally a loose federation of locals - into a modern national union; and with the policies and tactics that eventually brought within the fold of the

national organization all the pipe trades employed in building and other industries--plumbers, steam fitters, gas fitters, sprinkler fitters, and others. During the course of the forty years of unionism described in this volume the leaders and members of the national organizations of the pipe trades were confronted with many crucial and difficult issues - the relation of their organization to the Knights of Labor, the development of a viable system of union government and finances, the regulation of apprenticeship in plumbing and steam fitting, the problem of establishing jurisdictional lines among the members of a multi-craft union. The description and analysis of union policies toward these and other issues provide major insights into the process of growth of an important labor organization and, indeed, into the development of national unionism in America.
